

Exercise 8

已開始：9月27日 16:38

測驗說明

問題 1

50 分數

- If you are using a new platform this time (e.g., Raspberry Pi that you didn't use before for modules), then do the following:
 - `sudo apt update` && `sudo apt -y upgrade`
 - `sudo apt-get install raspberrypi-kernel-headers`
- Modify [this \(https://canvas.rice.edu/courses/59111/files/4929006/download?download_frd=1\)](https://canvas.rice.edu/courses/59111/files/4929006/download?download_frd=1). [↓](https://canvas.rice.edu/courses/59111/files/4929006/download?download_frd=1&download_frd=1) (https://canvas.rice.edu/courses/59111/files/4929006/download?download_frd=1&download_frd=1) module file (named `hello_open.c` in Files on Canvas) according to the instructions inside the file
 - This will help you make a module that implements the `open` system call for a "fake" character device
- We need a user application to call **open** for a fake character device we will play with
 - Make a C file called `testmeschar.c`
 - Include the header files `stdio.h`, `stdlib.h`, `unistd.h`, and `fcntl.h`
 - Inside the main function, print (using `printf`) a message to the console saying that we are running the program
 - Make a call to the C function `open()`
 - `open()`, which is part of the standard C library, takes two input arguments
 - The first input is a string that specifies the file path to our fake device we are making, which is at `/dev/****` [where `****` is the device name you chose]
 - The second argument is `O_RDWR`
 - Capital O, not zero; Used to read/write files
 - The output will be an integer; No need to do anything with it
 - `return 0`
- Download [this \(https://canvas.rice.edu/courses/59111/files/4929027/download?download_frd=1\)](https://canvas.rice.edu/courses/59111/files/4929027/download?download_frd=1). [↓](https://canvas.rice.edu/courses/59111/files/4929027/download?download_frd=1&download_frd=1) (https://canvas.rice.edu/courses/59111/files/4929027/download?download_frd=1&download_frd=1) Makefile (Files/Makefile for char test/Makefile on Canvas) and replace the all capitals text appropriately
- Now test it with the following commands, replacing `mes` with the class name you chose and `meschar` with the device name you chose:
 - **make**
 - **sudo insmod hello.ko**
 - **ls /dev**
 - **ls /dev/88*** (replacing 88 with the first few letters of your device name; * is a wildcard, different from a [Yellowcard](https://en.wikipedia.org/wiki/Ocean_Avenue_(song)) [\(https://en.wikipedia.org/wiki/Ocean_Avenue_\(song\)\)](https://en.wikipedia.org/wiki/Ocean_Avenue_(song)).)
 - **ls /sys/class/mes/meschar**
 - **cat /sys/module/hello/parameters/multiplier**
 - (other terminal window) **tail -f /var/log/kern.log**
 - Or: **dmesg**
 - **sudo ./test** (run many times) [MAKE SURE TO RUN WITH `sudo`!]
 - **sudo rmmod hello.ko**

Submit a screenshot of `dmesg` that contains text output corresponding to `insmod`, multiple runs of `./test`, and `rmmod`. Also copy and paste your c test file code and module code into the next two questions.
